

| Algorithmics | Student information  | Date  | Number of session |
|--------------|----------------------|---|-------------------|
|              | UO: 300829           | 20/02/2025  | 2                 |
|              | Surname: Cid Lazcano |  Escuela de Ingeniería Informática<br>Universidad de Oviedo |                   |
|              | Name: Izan           |   |                   |

## Activity 1. Bubble Algorithm

| n          | t ordered | t reverse | t random |
|------------|-----------|-----------|----------|
| 10000      | 679       | 2635      | 1929     |
| 2*10000    | 2761      | 10238     | 7353     |
| 2**2*10000 | 9101      | 40773     | 47100    |
| 2**3*10000 | 50733     | OoT       | OoT      |
| 2**4*10000 | OoT       | OoT       | OoT      |

The measurements align with the expected results since we are getting the lower values when the vector is already ordered, which is the best case for the bubble algorithm, and then in the reverse and random ordered vectors we get the quadratic complexity  $O(n^2)$  which is the one expected for average and worst cases with the bubble algorithm.

## Activity 2. Selection Algorithm

| n          | t ordered | t reverse | t random |
|------------|-----------|-----------|----------|
| 10000      | 640       | 633       | 670      |
| 2*10000    | 2323      | 2333      | 2422     |
| 2**2*10000 | 9037      | 8950      | 9311     |
| 2**3*10000 | 35847     | 34051     | 36438    |
| 2**4*10000 | OoT       | OoT       | OoT      |

The values obtained agree with what is expected since they all share the same  $O(n^2)$  complexity, just as it should be for the worst, average and best-case scenario when using selection algorithm.

| Algorithmics | Student information  | Date       | Number of session |
|--------------|----------------------|------------|-------------------|
|              | UO: 300829           | 20/02/2025 | 2                 |
|              | Surname: Cid Lazcano |            |                   |
|              | Name: Izan           |            |                   |

## Activity 3. Insertion Algorithm

| n           | t ordered | t reverse | t random |
|-------------|-----------|-----------|----------|
| 10000       | LoR       | 637       | 340      |
| 2*10000     | LoR       | 2197      | 1165     |
| 2**2*10000  | LoR       | 9375      | 4407     |
| 2**3*10000  | LoR       | 35050     | 17299    |
| 2**4*10000  | LoR       | OoT       | OoT      |
| 2**5*10000  | LoR       | OoT       | OoT      |
| 2**6*10000  | LoR       | OoT       | OoT      |
| 2**7*10000  | LoR       | OoT       | OoT      |
| 2**8*10000  | 109       | OoT       | OoT      |
| 2**9*10000  | 182       | OoT       | OoT      |
| 2**10*10000 | 353       | OoT       | OoT      |
| 2**11*10000 | 681       | OoT       | OoT      |
| 2**12*10000 | 1381      | OoT       | OoT      |
| 2**13*10000 | 2747      | OoT       | OoT      |

The obtained results are coherent with the expectations since we are getting a linear complexity  $O(n)$  for the ordered vector, that is the best-case scenario, and then quadratic complexities  $O(n^2)$  for the other two cases. Furthermore, the worst-case scenario is the reverse one since the insertion algorithm works better with small sizes or partially ordered elements, and we can see that reflected in the results.

## Activity 4. Quicksort Algorithm

| n           | t ordered | t reverse | t random |
|-------------|-----------|-----------|----------|
| 250000      | 59        | 66        | 247      |
| 2*250000    | 130       | 165       | 401      |
| 2**2*250000 | 294       | 310       | 824      |
| 2**3*250000 | 528       | 571       | 1880     |
| 2**4*250000 | 1034      | 1231      | 3777     |
| 2**5*250000 | 2149      | 2783      | 8598     |
| 2**6*250000 | 4392      | 7309      | 20453    |

| Algorithmics | Student information  | Date       | Number of session |
|--------------|----------------------|------------|-------------------|
|              | UO: 300829           | 20/02/2025 | 2                 |
|              | Surname: Cid Lazcano |            |                   |
|              | Name: Izan           |            |                   |

## Activity 5. Quicksort + Insertion Algorithm

| n                              | t random |
|--------------------------------|----------|
| Quicksort                      | 20687    |
| Quicksort + Insertion (k=5)    | 24785    |
| Quicksort + Insertion (k=10)   | 19979    |
| Quicksort + Insertion (k=20)   | 19700    |
| Quicksort + Insertion (k=30)   | 17604    |
| Quicksort + Insertion (k=50)   | 14704    |
| Quicksort + Insertion (k=100)  | 8293     |
| Quicksort + Insertion (k=200)  | 4782     |
| Quicksort + Insertion (k=500)  | 2772     |
| Quicksort + Insertion (k=1000) | 2565     |

With a very small  $k$  (like 5), the algorithm makes many recursive calls before switching to insertion sort. This increases overhead, as the recursive Quicksort calls—even on very small arrays—carry some constant time costs. Insertion sort has a best-case time complexity of  $O(n)$  when the array is nearly sorted. With higher  $k$ , more elements are sorted using insertion sort on subarrays that are already partially sorted by previous Quicksort partitions. This explains the improvement in performance as  $k$  increases. If  $k$  becomes too high, there could be a point where insertion sort's  $O(n^2)$  worst-case behaviour might start to hurt performance if the subarrays are not already nearly sorted.

| n                              | t random |
|--------------------------------|----------|
| Quicksort + Insertion (k=1050) | 36465    |
| Quicksort + Insertion (k=1100) | 38050    |
